Plans Could Prove Disastrous for New York

Get ready for higher energy prices, more blackouts, and huge conversion costs.

While we support efforts to lower carbon emissions, current plans to “electrify everything” in NY could prove disastrous. Families would be forced to spend upwards of \$20,000 to convert their homes to electric heat pumps and stoves. Energy costs would soar. The reliability of the electric grid could be severely compromised. New “Carbon Taxes” would be levied. All of this without much impact on the global climate.

Take Action Now!

New York’s Climate Action Council is accepting public comments on their proposed “scoping plans.” Make your voice heard.

Get ready for radical changes in your home

The way you heat your home, drive your car, and cook your food are all about to change radically, with huge increases in cost.

New York State's proposed climate action plans would force you to switch to electric cars, heaters, and stoves, no matter how much they cost, how poorly they perform, or how unreliable our electric grid becomes in the process. **It is the most radical, untested plan in the country.**

Propane Gas: Energy for Everyone that is part of the climate solution

Propane gas helps New York realistically achieve cleaner energy without the incredible disruption, risk and cost to families and businesses.

We can't afford to put all our eggs in one fragile electric basket.
